

# Chapter 3a

CARBON AND THE MOLECULAR DIVERSITY OF  
LIFE

# You Must Know:

- The properties of carbon that make it so important.

# I. Importance of Carbon

- Organic chemistry: branch of chemistry that specializes in study of carbon compounds
- Organic compounds: contain Carbon (& H)
- Major elements of life: CHNOPS
- Carbon can form large, complex, and diverse molecules

## II. Diversity of Carbon

- It has 4 valence electrons (tetravalence)

- It can form up to 4 covalent bonds
  - *Most frequent bonding partners: H, O, N*

## II. Diversity of Carbon

3. Bonds can be single, double, or triple covalent bonds.

**ethane**  
(an **alkane**)

**ethene**  
(an **alkene**)

**ethyne**  
(an **alkyne**)

## II. Diversity of Carbon

4. Carbon can form large molecules
  - o 4 classes of *macromolecules*: carbohydrates, proteins, lipids, nucleic acids

# II. Diversity of Carbon

5. Molecules can be chains, ring-shaped, or branched

(a) Length

Ethane

Propane

(c) Double bond position

1-Butene

2-Butene

(b) Branching

Butane

2-Methylpropane  
(isobutane)

(d) Presence of rings

Cyclohexane

Benzene

# II. Diversity of Carbon

## 6. Forms isomers

- *Molecules have same molecular formula, but differ in atom arrangement*
- *different structures* → *different properties/functions*

Structural Isomer	Cis-Trans Isomer	Enantiomers
Varies in covalent arrangement	Differ in spatial arrangement	Mirror images of molecules

(a) Structural isomers

Pentane

© 2015 Pearson Education, Inc.

2-methyl butane

(b) *Cis-trans* isomers

*cis* isomer: The two Xs are on the same side.

© 2015 Pearson Education, Inc.

*trans* isomer: The two Xs are on opposite sides.

(c) Enantiomers

© 2015 Pearson Education, Inc.

# Drug manufacturing:

Thalidomide =

- "good" enantiomer → reduce morning sickness
- "bad" enantiomer → cause birth defects
- "good" converts to "bad" in patient's body
- Now used to treat cancers, leprosy, HIV

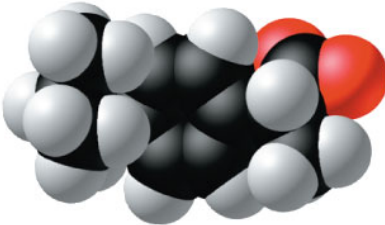

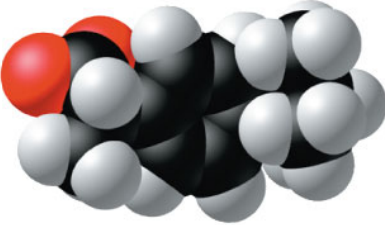

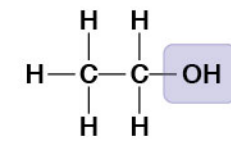

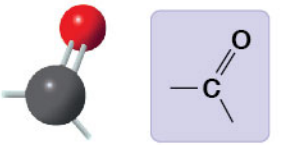

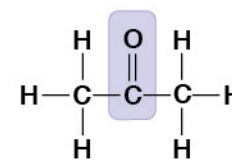

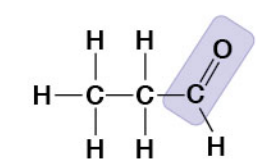

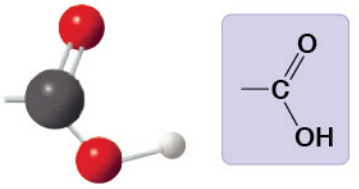

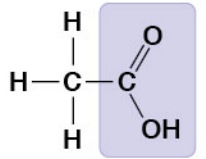

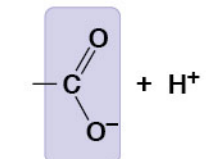

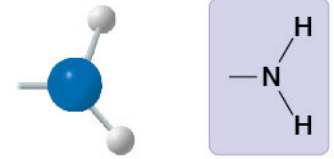

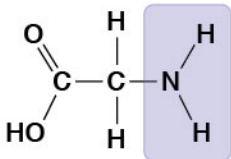

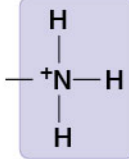

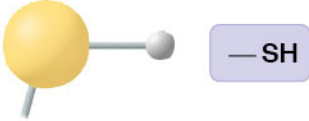

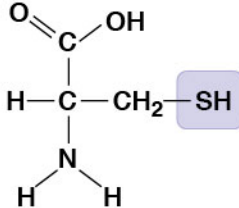

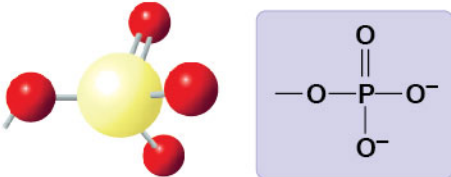

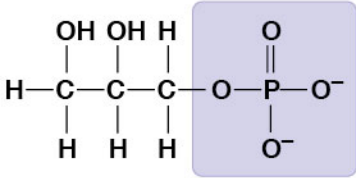

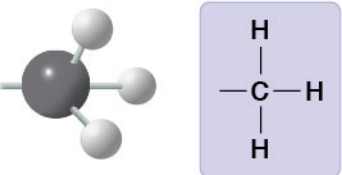

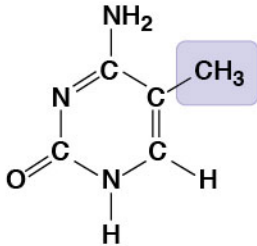

Fig. 4.8 The pharmacological importance of enantiomers

<b>Drug</b>	<b>Condition</b>	<b>Effective Enantiomer</b>	<b>Ineffective Enantiomer</b>
<b>Ibuprofen</b>	<b>Pain; inflammation</b>	 <b>S-Ibuprofen</b>	 <b>R-Ibuprofen</b>
<b>Albuterol</b>	<b>Asthma</b>	 <b>R-Albuterol</b>	 <b>S-Albuterol</b>

# III. Functional Groups

- Behavior of organic molecules depends on functional groups
- Most common functional groups:
  - *Hydroxyl*
  - *Carbonyl*
  - *Carboxyl*
  - *Amino*
  - *Sulfhydryl*
  - *Phosphate*
  - *Methyl*

Chemical Group	Compound Name	Examples
<b>Hydroxyl group (—OH)</b>  (may be written HO—)	<b>Alcohol</b>	 <b>Ethanol</b>
<b>Carbonyl group (&gt;C=O)</b> 	<b>Ketone</b>  <b>Aldehyde</b>	 <b>Acetone</b>  <b>Propanal</b>
<b>Carboxyl group (—COOH)</b> 	<b>Carboxylic acid, or organic acid</b>	 <b>Acetic acid</b> $\rightleftharpoons$  <b>Ionized form of —COOH</b>
<b>Amino group (—NH<sub>2</sub>)</b> 	<b>Amine</b>	 <b>Glycine</b> $+ H^+ \rightleftharpoons$  <b>Ionized form of —NH<sub>2</sub></b>

Chemical Group	Compound Name	Examples
<p><b>Sulfhydryl group (—SH)</b></p> 	<p><b>Thiol</b></p>	 <p><b>Cysteine</b></p>
<p><b>Phosphate group (—OPO<sub>3</sub><sup>2-</sup>)</b></p> 	<p><b>Organic phosphate</b></p>	 <p><b>Glycerol phosphate</b></p>
<p><b>Methyl group (—CH<sub>3</sub>)</b></p> 	<p><b>Methylated compound</b></p>	 <p><b>5-Methyl cytosine</b></p>
